

Supplementary Figure 1 for Gabriel et al, 2006

Data from Affymetrix Yeast tiling array hybridized with W303 DNA, for each chromosome. Signals above the central horizontal line of each chromosome correspond to sequence polymorphisms relative to the S288c sequence. Contiguous regions with many polymorphisms are likely derived from a parent that is not S288c, while regions with very few polymorphisms are likely derived from S288c.
